**PCS AG, an IT company from Solingen, Germany has developed this solution for a successful handling of printers with Sage and a terminal server environment.**

### Fields of application

- working with printers and Sage Classic Line in a terminal server environment

**PCSterm** allows the fault-free operation of local printers (mapped in remote desktop session) within Sage Classic Line in a terminal server environment.

A well-known problem with Microsoft Terminal Servers is that with every new client registration the name of the printer and the connection port are changed (printer 1 in session xy).

**PCSterm** solves the problem. It modifies the Sage printer files (PRW files) and the name of the printer and the connection port are set to the current values in the terminal session.
